README — PROJECT RUNNING GUIDE

Overview

A beginner-friendly Streamlit demonstration that displays an uploaded leaf photo and calculates rough green-toned and brown-toned pixel proportions across the whole image.

Important limitation

This is **not** a machine-learning disease classifier and does not diagnose disease. Background, shadows, camera settings, and lighting strongly affect the measurements. Do not use the output to choose pesticide or treatment.

Requirements

- Python 3.10 or newer

- Packages listed in `requirements.txt`

Setup

1. Install Python.

2. Open a terminal in this folder.

3. Create and activate a virtual environment (recommended).

4. Install packages:

`pip install -r requirements.txt`

5. Run:

`streamlit run app.py`

6. Open the local address shown in the terminal and upload a JPG or PNG leaf photo.

Files

- `app.py` — application source code

- `requirements.txt` — Python dependencies

- `Project_Report.pdf` — project report

Future improvement

To build a genuine disease classifier, select a properly licensed labelled dataset, split it into training/validation/test sets, train a documented model, evaluate it on held-out data, and report actual

metrics. Do not claim accuracy before testing.
